

Thimbles and Links

Supplied in a number of sizes to match the diameter of the rope or wire they being used on. The link and thimble is a device used to support the eye formed at the end of a rope or wire.

The thimble can be supplied galvanised and with a gusset if additional strength is required. The link inserted into the thimble during manufacture enables a coupling link or shackle to be attached. Its strength and physical size allow it to be passed through machinery.

Features:

- Variety of sizes available
- Low size footprint allows it to be passed through and around machinery
- Certificated Product

Applications:

- Used to re-enforce a rope or wire cable end when additional strength is required.

Associated Tools /Equipment:

- Steel wire or rope
